Sequence 507 AA;

```
The present sequence represents a secreted or transmembrane polypeptide. CC The specification describes polypeptides designated PRO1484, PRO4334, PRO4352, PRO1889, PRO1887, PRO1875, PRO4355, PRO4355, PRO4355, PRO4355, PRO4355, PRO4356, PRO4355, PRO4356, PRO4356, PRO4356, PRO4357, PRO4408, PRO5737, PRO4405, PRO5990, PRO6030, PRO4424, PRO4422, PRO430 and PRO4499, PRO1889 polypeptide is useful for diagnosing tumour in a mammal. The polypeptides, their caponists and antagonists are useful treating a condition associated with expression or activity of the polypeptide. Conditions treated include consisty, diabetes or hyper-or hypo-insulinemia. The polypeptides are capable of inducing proliferation of mammalian kidney mesangial cells and are therefore useful for treating kidney disorders associated with CC capable of inducing proliferation such as Bergers disease or other nephropathies associated with Schonlein-Henoch purpura, cellac disease, cellac disease, comparate transgenic animals for use in development and screening of the specific acids may be used to generate transgenic animals for use in development and screening of the part of the specific acids may be used to generate transgenic animals for use in development and screening of the propertically useful reagents and also for chromosome identification and the propertically useful reagents and also for chromosome identification and capable of the propertically useful reagents and also for chromosome identification and capable of the propertically useful reagents and also for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23-MAR-1999

                                                                                                                             The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as a localised neuropathies and central nervous system disease, supotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activin/inhibin activity, cancer diagnosis and therapy, drug screening, and shrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form

                                                                                                                                                                                                                                                                                                                           immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and c.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
The present invention describes a method for identifying a compound (C) capable of treating a pain disorder comprising assaying the ability of the compound to modulate 9949, 14230, 760, 6253, 12216, 17719, 41897, 47174, 33408, 10002, 16209, 314, 636, 27410, 33260, 619, or 13424 nucleic acid expression or 9949, 14230, 760, 62553, 12216, 17719, 41897, 47174, 33408, 10002, 16209, 314, 636, 27410, 33260, 619, 15985, polypeptide activity. Also described: (1) identifying a compound (C) capable of modulating a pain signalling mechanism; and (2) treating a subject having a pain disorder characterised by aberrant nucleic acid expression or polypeptide activity. (C) has analgesic, antimigraine and antiinflammatory activities, and can be used in gene therapy. The method
                                                                                                                                                                                                                                                                                                                                                                               10-JUN-2002;

PATENT NO. 6639063
GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Jobert, S.
APPLICANT: Glordano, J.Y.
TITLE OF INVENTION: ESTS and Encoded Human Proteins.
FILE REFERENCE: GENSET.054PR2
CURRENT APPLICATION NUMBER: US/09/621,976
CURRENT FILING DATE: 2000-07-21
                                               NUMBER OF SEQ ID NOS: 19335

Sequence 242, Application US/09731872

Patent No. US20020102604A1

GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, Jean Baptiste
APPLICANT: Bougueleret, Lydie
APPLICANT: Jobert, Severin

TITLE OF INVENTION: FULL-LENGTH HUMAN CDNAS ENCODING POTENTIALLY SECRETED PROTEINS
FILE REFERENCE: 78.US3.REG
CURRENT APPLICATION NUMBER: US/09/731,872
CURRENT APPLICATION NUMBER: US 60/169,629
PRIOR PILING DATE: 1999-12-08
PRIOR PILING DATE: 2000-03-06
NUMBER OF SEQ ID NOS: 482
SOFTWARE: Patent.pm
                                                                                                                                                                                                         RESULT 1
US-09-731-872-242
                                                                                                                                                                                                                                                                                                   US-10-232-227-32
